Director General's Award, Awarded from NIMS on Dec 31, 2021, for dedication to the development of an artificial intelligence-based emulator for physics processes in numerical models.

4. Research Interests

My research is grounded in the philosophy that *today's posterior is tomorrow's prior*. I treat pre-trained models as foundational *priors* and investigate how to effectively transfer, adapt, and compress their knowledge into specialized *posteriors* that are more capable, cost-efficient, and personally tailored.

Contextual Specialization: Developing compact, specialized models via surgical ablation of redundant global knowledge while preserving task-specific reasoning and agentic capabilities.

Efficient Knowledge Adaptation: Transforming general priors into contextualized posteriors via sequential Bayesian updating and distillation for resource-efficient and sustainable deployment.

Self-Evolving and Robust Reasoning: Enhancing model intelligence via self-play and feedback-guided alignment with context-aware guardrails for secure human-AI collaboration.
